

Abstract of the Disclosure

5 A network system is provided for enabling priority-based number
switching from a lower priority access number to a higher priority access
number during an active data session is provided. The system comprises, a
CTI-switch for establishing call connections and performing call switching
according to instruction, a network-hosted part of a software application for
monitoring the current user-node connection states and the current states of
10 the alternate access numbers, at least two network-access nodes connected
to the network, the access nodes each accessible through dialing a network-
access number from the user node and, a client-hosted part of the software
application for listing access numbers, configuring priority states to the
access numbers and for communicating the pertinent data to the network-
15 hosted part of the software application. The system affects call transfer
based on priority state.
